1. Overview

Advantech SQFlash 720-D series M.2 2230 (A+E Key) PCIe/NVMe SSD (Solid State Drive) delivers all the advantages of flash disk technology with PCIe Gen3 x2 interface, including being compliant with NGFF M.2 2230 (A+E Key) form factor. The device offers a wide range of capacities up to 512GB and its performance can reach up to 1200 MB/s (for read) and 900 MB/s (for write) based on Kioxia 3D TLC flash. The lower power consumption makes it an ideal storage choice for high performance demanding mobile devices.

2. Features

■ PCIe Interface

- Compliant with NVMe 1.3
- PCI Express Base 3.1
- PCIe Gen 3 x 2 lane & backward compatible to PCIe Gen 2 and Gen 1
- Support up to QD 128 with queue depth of up to 64K
- Support power management (optional)

■ Operating Voltage : 3.3V

■ Support LDPC of ECC algorithm

■ Support SMART and TRIM commands

■ Temperature Ranges¹

- Commercial Temperature
 - 0°C to 70°C for operating
 - -40°C to 85°C for storage
- Industrial Temperature
 - -40°C to 85°C for operating
 - -40°C to 85°C for storage

*Note : 1. Based on SMART Attribute (Byte index [2 :1] of PCIe-SIG standard, which measured by thermal sensor

■ Mechanical Specification

- Shock : 1,500G / 0.5ms
- Vibration : 20G / 80~2,000Hz

■ Humidity

- Humidity : up to 95% under 40°C

■ Acquired RoHS 、 WHQL 、 CE 、 FCC Certificate

■ Acoustic : 0 dB

■ Dimension : 30.0 mm x 22.0 mm x 3.8 mm

3. Specification Table

■ Performance

		Sequential Performance (MB/sec)		Random Performance (IOPS @4K)	
		Read	Write	Read	Write
3D TLC (BiCS5)	128 GB	1,150	550	95K	125K
	256 GB	1,150	900	150K	200K
	512 GB	1,200	900	130K	210K
3D sTLC (BiCS5)	32 GB	TBD	TBD	TBD	TBD
	64 GB	TBD	TBD	TBD	TBD
	128 GB	TBD	TBD	TBD	TBD

* Subject to change based on firmware migration.

NOTES:

1. The performance was estimated based on Kioxia 3D TLC BICS5 flash.
2. Performance may differ according to flash configuration and platform.
3. The table above is for reference only. The criteria for MP (mass production) and for accepting goods shall be discussed based on different flash configuration

■ Endurance

JEDEC defined an endurance rating TBW (TeraByte Written), following by the equation below, for indicating the number of terabytes a SSD can be written which is a measurement of SSDs' expected lifespan, represents the amount of data written to the device.

$$TBW = [(NAND\ Endurance) \times (SSD\ Capacity)] / WAF$$

- **NAND Endurance:** Program / Erase cycle of a NAND flash.
 - SLC: 100,000 cycles
 - Ultra MLC: 30,000 cycles
 - MLC: 3,000 cycles
 - 3D TLC (BiCS3/BiCS4/BiCS5): 3,000 cycles
 - 3D sTLC (BiCS4): 30,000 cycles
- **SSD Capacity:** SSD physical capacity in total of a SSD.
- **WAF:** Write Amplification Factor (WAF), as the equation shown below, is a numerical value representing the ratio between the amount of data that a SSD controller needs to write and the amount of data that the host's flash controller writes. A better WAF, which is near to 1, guarantees better endurance and lower frequency of data written to flash memory.

$$WAF = (Lifetime\ write\ to\ flash) / (Lifetime\ write\ to\ host)$$

Endurance measurement is based on JEDEC 219A client workload and verified with following workload conditions,

- PreCond%full = 100%
- Trim commands enabled
- Random data pattern.

	WAF	TBW
		3D TLC (BiCS5)
128 GB	3.5	110
256 GB	3.2	240
512 GB	2.9	520

	WAF	TBW
		3D sTLC (BiCS5)
32 GB	TBD	TBD
64 GB	TBD	TBD
128 GB	TBD	TBD

4. General Description

■ Error Correction Code (ECC)

Flash memory cells will deteriorate with use, which might generate random bit errors in the stored data. Thus, SQF-C3A 720-D applies the LDPC algorithm, which can detect and correct data errors even with the latest 3D TLC technology to ensure data being read correctly, and protects data from corruption.

■ Wear Leveling

NAND flash devices can only undergo a limited number of program/erase cycles, when flash media is not used evenly, some blocks get updated more frequently than others and the lifetime of device would be reduced significantly. Thus, wear leveling is applied to extend the lifespan of NAND flash by evenly distributing write and erase cycles across the media.

SQFlash 720-D series provides advanced wear leveling algorithm, which can efficiently spread out the flash usage through the whole flash media area. Moreover, by implementing both dynamic and static wear leveling algorithms, the life expectancy of the NAND flash is greatly improved.

■ Bad Block Management

Bad blocks are blocks that do not function properly or contain more invalid bits causing stored data unstable, and their reliability is not guaranteed. Blocks that are identified and marked as bad by the manufacturer are referred to as “Early Bad Blocks”. Bad blocks that are developed during the lifespan of the flash are named “Later Bad Blocks”. SQFlash 720-D series implements an efficient bad block management algorithm to detect the factory-produced bad blocks and manages bad blocks that appear with use. This practice prevents data being stored into bad blocks and further improves the data reliability.

■ Power Loss Protection: Flush Manager

Power Loss Protection is a mechanism to prevent data loss during unexpected power failure. DRAM is a volatile memory and frequently used as temporary cache or buffer between the controller and the NAND flash to improve the SSD performance. However, one major concern of the DRAM is that it is not able to keep data during power failure. Accordingly, SQFlash SSD applies the Flush Manager technology, only when the data is fully committed to the NAND flash will the controller send acknowledgement (ACK) to the host. Such implementation can prevent false-positive performance and the risk of power cycling issues.

In addition, it is critical for a controller to shorten the time the in-flight data stays in the controller internal cache. Thus, SQFlash applies an algorithm to reduce the amount of data resides in the cache to provide a better performance. With Flush Manager, incoming data would only have a “pit stop” in the cache and then move to NAND flash directly. Also, the onboard DDR will be treated as an “organizer” to consolidate incoming data into groups before written into the flash to improve write amplification.

■ TRIM

TRIM is a feature which helps improve the read/write performance and speed of solid state drives (SSD). Unlike hard disk drives (HDD), SSDs are not able to overwrite existing data, so the available space gradually becomes smaller with each use. With the TRIM command, the operating system can inform the SSD so that blocks of data that are no longer in use can be removed permanently. Thus, the SSD will perform the erase action, which prevents unused data from occupying blocks at all time.

■ SMART

SMART, an acronym for Self-Monitoring, Analysis and Reporting Technology, is an open standard that allows a solid state drive to automatically detect its health and report potential failures. When a failure is recorded by SMART, users can choose to replace the drive to prevent unexpected outage or data loss. Moreover, SMART can inform users impending failures while there is still time to perform proactive actions, such as save data to another device.

■ Over-Provision

Over Provisioning refers to the preserving additional area beyond user capacity in a SSD, which is not visible to users and cannot be used by them. However, it allows a SSD controller to utilize additional space for better performance and WAF. With Over Provisioning, the performance and IOPS (Input/Output Operations per Second) are improved by providing the controller additional space to manage P/E cycles, which enhances the reliability and endurance as well. Moreover, the write amplification of the SSD becomes lower when the controller writes data to the flash.

■ Thermal Throttling

The purpose of thermal throttling is to prevent any components in a SSD from over-heating during read and write operations. Thermal Throttling function is for protecting the drive and reducing the possibility of read / write error due to overheat. The temperature is monitored by the thermal sensor. As the operating temperature continues to increase to threshold temperature, the Thermal Throttling mechanism is activated. At this time, the performance of the drive will be significantly decreased to avoid continuous heating. When the operating temperature falls below threshold temperature, the drive can resume to normal operation.

■ Advanced Device Security Features

• Advanced Encryption Standard (AES)

An AES 256-bit encryption key is generated in the drive's security controller before the data gets stored on the NAND flash. When the controller or firmware fails, the data that is securely stored in the encryption key becomes inaccessible through the NAND flash.

• OPAL 2.0 support

SQFlash 720-D series supports standard OPAL 2.0 function for advance Self-Encryption Drive (SED) feature sets. Advantech provides also user friendly interface for setting disk / system bonding to prevent SSD be used in non-authorized platforms, which is called Flash Lock function.

• Secure Erase Function

SQFlash 720-D series supports standard NVMe command for secure erase function; when the SSD controller receive the secure erase command, the erase process will reset all blocks and erase all of the user data in the SSD.

• Sanitize Function

SQFlash 720-D series default implement NVMe Sanitize Device Feature set, which supports the command set of Block Erase, Overwritten and Crypto Scramble. With the internal AES encryption support, the Crypto Scramble process will start with resetting AES key. By doing so, existing data will be scrambled within 10ms and cannot be recovered anymore. Moreover, erase flag is set when erase function is triggered, which will ensure the whole erase process can be 100% completed. Even there's power interrupt, after power resume, erase operation will be resume right away as well.

• Write Protect Function

SQFlash 720-D series default support Write Protect function, when the write protect function enabled, all of the write command will carried to a buffer area without real programming to the Flash IC. Therefore, the data won't be saved in this mode and will be totally discarded upon power shutting down.

■ Block Diagram

■ LBA value

Density	LBA
32 GB	62,533,296
64 GB	125,045,424
128 GB	250,069,680
256 GB	500,118,192
512 GB	1,000,215,216

5. Pin Assignment and Description

■ Interface Pin Assignments

Below table defines the signal assignment of the internal NGFF connector for SSD usage, described in the PCI Express M.2 Specification version 1.0 of the PCI-SIG.

Pin No.	PCIe Pin	Description
1	GND	Ground
2	3.3V	3.3V
3	NC	Not connected
4	3.3V	3.3V
5	NC	Not connected
6	NC	No connect. Reserve for GPIO DAS customized
7	GND	Ground
8	Module Key A	Module Key
9	Module Key A	
10	Module Key A	
11	Module Key A	
12	Module Key A	
13	Module Key A	
14	Module Key A	
15	Module Key A	
16	NC	Not connected
17	NC	Not connected
18	GND	Ground
19	NC	Not connected
20	NC	Not connected
21	NC	Not connected
22	NC	Not connected
23	NC	Not connected
24	Module Key E	Module Key

65	PETp1	PETp1
66	NC	Not connected
67	PETn1	PETn1
68	NC	Not connected
69	GND	Ground
70	NC	Not connected
71	NC	Not connected
72	3.3V_3	3.3V_3
73	NC	Not connected
74	3.3V	3.3V
75	GND	Ground

■ Hardware Jumper Feature Set

SQFlash 720-D mounted a 2-pin jumper on the PCB, which can control the specific feature enable/disable. Hardware jumper feature set default support Write Protect function, and optionally the pin can be set to Data Erase.

- Short jumper → Data Erase enabled or Write Protect enabled
- Remove jumper → Data Erase disabled or Write Protect disabled

6. NVMe Command List

■ Admin commands

Opcode	Command Description
00h	Delete I/O Submission Queue
01h	Create I/O Submission Queue
02h	Get Log Page
04h	Delete I/O Completion Queue
05h	Create I/O Completion Queue
06h	Identify
08h	Abort
09h	Set Features
0Ah	Get Features
0Ch	Asynchronous Event Request
10h	Firmware Activate
11h	Firmware Image Download
NVM Command Set Specific	
80h	Format NVM
81h	Security Send
82h	Security Receive
84h	Sanitize

■ NVM commands

Opcode	Command Description
00h	Flush
01h	Write
02h	Read
04h	Write Uncorrectable
08h	Write Zeroes
09h	Dataset Management

7. Identify Device Data

The Identify Device Data enables Host to receive parameter information from the device. The parameter words in the buffer have the arrangement and meanings defined in below table. All reserve bits or words are zero

■ Identify Controller Data Structure

Bytes	O/M	Description	Default Value
01:00	M	PCI Vendor ID (VID)	0x1987

9. System Power Consumption

■ Supply Voltage

Parameter	Rating
Operating Voltage	3.3V

■ Power Consumption

(mW)		Read	Write	Idle
3D TLC (BiCS5)	128 GB	1,700	1,400	800
	256 GB	1,800	1,750	800
	512 GB	1,900	1,850	800

(mW)		Read	Write	Idle
3D sTLC (BiCS5)	32 GB	TBD	TBD	TBD
	64 GB	TBD	TBD	TBD
	128 GB	TBD	TBD	TBD

1. The average value of power consumption is achieved based on 100% conversion efficiency.
2. The measured power voltage is 3.3V.
3. Samples were built of Toshiba 3D TLC (BiCS5) flash and measured under ambient temperature.
4. Sequential R/W is measured while testing 1MB sequential R/W 3 times by IOMeter.
5. Power Consumption may differ according to flash configuration and platform.

M.2 2230 (A+E key) PCIe/NVMe SSD (Unit: mm)

Appendix: Part Number Table

3D TLC (BiCS5)

Product	Advantech PN
SQF 720-D PCIe/NVMe M.2 2230 128G BiCS5 3D TLC (0~70°C)	SQF-C3AV1-128GDEDC
SQF 720-D PCIe/NVMe M.2 2230 256G BiCS5 3D TLC (0~70°C)	SQF-C3AV1-256GDEDC
SQF 720-D PCIe/NVMe M.2 2230 512G BiCS5 3D TLC (0~70°C)	SQF-C3AV1-512GDEDC
